

1) Getting started:

- Download a text editor so you can edit the HTML. Brackets would be a very good choice - <http://brackets.io/>
- Once installed open the main folder for your website with it.
- You will be editing index.html primarily.

2) About section:

- Your about section starts on line 55 in index.html.
- You want to edit the text between the <p> tags.
- If you want to add additional paragraphs simply add additional <p> tags under the first.

3) Image section:

- Your image gallery starts on line 78.
- Each entry looks something like this:
 - ` `
- **a href="images/1.jpg"** is the link to the main full res image. Between the quotes is the file path to the full res image.
 - If you want to replace this image with a higher res version you either make the replacement image have the same name, or update this line of code to show the appropriate file name and/or path.
- **data-lightbox="projects"** Should be left as is.
- **data-title="Caption here"** Caption here should be replaced with the caption you want to show on the image.
- `` This is the thumbnail image.
 - Notice the thumbnail is a separate file and located in a slightly different file path.
 - All thumbnails have been cropped to 400x400 px to look uniform.
 - `alt="table frame"` is the text that shows if the images can't load, (or the viewer is using a screen reader for a disability or whatnot).
- If you want to add additional images there is basically 3 steps:
 1. Put a high res copy in the img folder
 2. Put a 400x400 copy in the thumbs folder
 3. Fill in the blanks of this code and paste it below the last image in the gallery:
 - ` `

4) Contact buttons:

- The page has two social buttons: one for facebook and one for email.
- The email needs to be completed with whatever address you want to receive to.
- On line 108 you will see:
 - ` <i class="fa fa-envelope fa-4x" aria-`

*hidden="true"></i> *

- Replace the generic address with whichever you want to use.
